

AI-Generated Code: Understanding Its Impact on Existing Systems

How AI-assisted PR analysis reveals changed areas, connected dependencies, blast radius, and regression risks before human approval.

01

THE CHALLENGE

When AI generates code, we lacked visibility into:

- What was actually required
- What was additionally done
- Blast radius of changes
- Impact on existing stable features

! No visibility = Risk to existing stable features

EXPECTED VS AI-GENERATED CHANGES

EXPECTED (WHAT WAS REQUIRED)

- Requested feature (defined in requirement)
- Known files / modules in scope
- Known impact (limited & clear)
- Expected impact understood

VS

AI-GENERATED CHANGES IN THE PR

- Requested feature + additional changes
- More files / modules modified
- Unknown indirect impact
- Possible regression to old stable features

02

OUR SOLUTION: AI AGENT FOR PR IMPACT ANALYSIS

03

HUMAN + AI REVIEW PROCESS

🏆 Humans make the final call. AI provides clarity.

OUTCOME

Key

Takeaway:

We combined our existing SDLC process with AI context + AI-assisted PR impact analysis + Human review

Smarter AI, Safer Code, Better Delivery
